Fintech Daily · AI news agent

Every morning, 7 fact-checked fintech stories for professionals in Chinese, English and Russian. Automated from 54 sources to an on-the-minute post, with a human accountable for what goes out.

AI PRODUCT CASE · SOLO PROJECT

Product owner · built end to end

Sep 2026 – present · live

● **08:30** Singapore · @fintech_daily_zh **08:30** Moscow · @fintech_daily_ru **07:30** UTC · @fintech_daily

7 stories a day · week in review on Mondays

45 /45
issues published on time, none missed

0 min
publishing delay, down from 11.8 min; 33/33 on the minute

15%
of AI-written entries fixed by guardrails before publishing (46/306)

74%
of problems caught by deterministic code, not by an LLM

$0
monthly running cost, all within free tiers

The problem PROBLEM

Fintech news is scattered across dozens of outlets, newsletters and regulators, mostly in English. A human-edited daily in three languages is expensive. Letting an LLM write finance news is risky: one wrong amount, or "pending" written as "approved", and readers stop trusting the channel.

> **How do you get an unstable model that hallucinates to publish trustworthy content on time, every day, on a zero budget?**

Trust first
every fact traceable to the source

On time is a promise
says 08:30, posts at 08:30

No repeats
yesterday's event never returns

Zero cost
sustainable on free tiers

A real digest entry OUTPUT

@fintech_daily · 2026-10-08 story 1 of 7

Stripe and FedEx partner on SMB lending

Stripe and FedEx are teaming up to offer capital to smaller businesses by merging operational and financial data.

→ **Why it matters:** Combining logistics and financial metrics can unlock alternative underwriting signals for SMB credit.

Multi-agent pipeline ARCHITECTURE

code · LLM · human

① COLLECT & FILTER
Code pre-filter
54 RSS sources · 13 regulators
same event merged, 10-day memory
authority · coverage · freshness → top 80

→

② SELECT & WRITE
Selector · writer agents
7 stories + 3 reserves from 80
full article text fetched
written with verbatim source quotes

→

③ GUARDRAILS
Code checks + cross-model review
every number and date must be quoted
another model checks facts, status, terms, repeats
one repair pass, else dropped and replaced

→

④ HUMAN
Editor review · on time
draft + quality report to the editor
veto · approve · "Rewrite"
posted in each market's time zone

Key product decisions DECISIONS

1. **Route models by data, not by instinct**
   An audit showed every new repeat came on days a lightweight fallback model did the selection → **wait for the main model only at selection**; other steps fall back and guardrails hold quality; a second repeat check added. 5 repeats caught in 3 days.
2. **On time is a product promise**
   The channel said 08:30, posts went out around 08:43 → an external scheduler wakes the bot on the minute; every run is idempotent. Budgeted the free tier first and removed ~330 wasted minutes a month. **Delay 11.8 → 0 min.**
3. **Autonomy for the AI, a veto for the human**
   Auto (veto) and manual (approve) modes with a 20-minute veto window. "Rewrite" may only use the original sources and re-runs every guardrail; **an edit that fails keeps the old text**.
4. **Launch is not the finish line**
   A week after a fix that passed its tests, every post was audited again and a new root cause surfaced. **In LLM systems, passing tests is not the same as working in production.**

Four guardrail layers GUARDRAILS

Grounding written from full text, with verbatim quotes	grounding
Deterministic checks numbers and sources must match	34 / 46
Cross-model review LLM-as-judge: status, roles, terms	12 / 46
Human veto one tap stops a post	human

Evals & metrics: offline checks (0 model calls) · blind LLM-as-judge on its own quota · weekly metric snapshots; every issue logs guardrail hits, fallbacks and token usage · detects silent model redirects.

Deliberately not built: long-form explainers. Short entries already need fixes 15% of the time; long texts multiply hallucination risk and review cost.

AI-native way of working

Built with Claude Code as the AI coding tool. **I owned** problem discovery, requirements and acceptance criteria, trade-off decisions, PR review and post-launch audits; **the AI tool** proposed designs, wrote the code and the tests.

Engineering & stack

2 days to MVP · **120** unit tests + CI
